(2) a)
$$y' = y^2 \rightarrow -\frac{4}{y^2} = -1 \implies \frac{1}{y} = -x + c \implies y = \frac{1}{c - x}$$

b) $y' = \frac{1}{y^2} - 3y^2y' = 3 \implies y^3 = 3x + c \implies y = 3x + c$

(3.) $xy' = y^2 + 4y$ szétválasztható

 $y^2 + 4y = x$

$$\frac{dy}{dx} = \frac{1}{x} \implies \int \frac{dy}{y^2 + 4y} = \int \frac{dx}{x} \implies \int \frac{1}{y(y+4)} dy = \int \frac{dy}{y^2 + 4y} = \int \frac{dy}{x} = \int \frac{1}{y(y+4)} dy = \int \frac{dy}{y^2 + 4y} = \int \frac{1}{y(y+4)} dy = \int \frac{dy}{y(y+4)} dy = \int \frac{$$

Egyöntetű fohzámús DE

$$y' = f(\frac{y}{x}) \longrightarrow u(x) = \frac{y(x)}{x}$$
 et hell helyettesíteni

 $y' = (ux) = y' \cdot x + u = f(u)$
 $u' \cdot x = f(u) - u$ szetvalazt

 $u' \cdot x = f(u) - u$ szetvalazt

 $u' \cdot x + u = \frac{2x + ux}{x - ux} = \frac{2 + u}{1 - u} \longrightarrow u' \cdot x = \frac{2 + u}{1 - u} - \frac{u - u^2}{1 - u} = \frac{2 + u^2}{1 - u}$
